

Lambda_with_filter()

Example:- (Even numbers)

```
nums = [1, 2, 3, 4, 5, 6]

res = filter(lambda x: x % 2 == 0, nums)
print(list(res))

# O/P:
# [2, 4, 6]
```

Example:- (Odd numbers)

```
nums = [1, 2, 3, 4, 5]

res = filter(lambda x: x % 2 != 0, nums)
print(list(res))

# O/P:
# [1, 3, 5]
```

Example:- (Positive numbers)

```
nums = [-2, -1, 0, 1, 2]

res = filter(lambda x: x > 0, nums)
print(list(res))

# O/P:
# [1, 2]
```

Example:- (Numbers greater than 10)

```
nums = [5, 10, 15, 20]

res = filter(lambda x: x > 10, nums)
print(list(res))

# O/P:
# [15, 20]
```

Example:- (Strings with length > 3)

```
names = ["Ram", "Neeraj", "Amit", "Raj"]

res = filter(lambda x: len(x) > 3, names)
print(list(res))

# O/P:
# ['Neeraj', 'Amit']
```

Example:- (Vowels from string)

```
text = "Neeraj"

res = filter(lambda x: x.lower() in 'aeiou', text)
print(list(res))

# O/P:
# ['e', 'e', 'a']
```

Example:- (Numbers divisible by 3)

```
nums = [3, 5, 9, 10, 12]

res = filter(lambda x: x % 3 == 0, nums)
print(list(res))

# O/P:
# [3, 9, 12]
```

Example:- (Non-zero values)

```
nums = [0, 1, 2, 0, 3]

res = filter(lambda x: x != 0, nums)
print(list(res))

# O/P:
# [1, 2, 3]
```

Example:- (Uppercase letters)

```
text = "PyThOn"

res = filter(lambda x: x.isupper(), text)
print(list(res))

# O/P:
# ['P', 'T', 'O']
```

Example:- (Starts with 'A')

```
names = ["Amit", "Neeraj", "Ankit", "Rahul"]

res = filter(lambda x: x.startswith('A'), names)
print(list(res))

# O/P:
# ['Amit', 'Ankit']
```
