

Transfer statement

In Python, the term transfer statements (also called control flow statements) refers to statements that change the normal flow of execution in loops or functions.

Main Transfer Statements in Python:

1. break
2. continue
3. pass
4. return

1. break:-

1. Used to exit/terminate the loop immediately.
2. Control moves outside the loop.

```
for i in range(5):  
    if i == 3:  
        break  
    print(i)
```

O/P:-

```
0  
1  
2
```

2. continue:-

1. Used to skip the current iteration
2. Loop continues with next iteration

```
for i in range(5):  
    if i == 3:  
        continue  
    print(i)
```

O/P:-

```
0  
1  
2  
4
```

3. pass:-

1. Does nothing (placeholder)
2. Used when a statement is required syntactically but no action is needed

```
for i in range(5):  
    if i == 3:  
        pass  
    print(i)
```

O/P:-

```
0  
1  
2  
3  
4
```

4. return:-

1. Use to terminate function.
2. Used inside a function to exit and return a value.

```
def add(a, b):  
    return a + b  
  
print(add(2, 3))
```

O/P:-

```
5
```
